Ex. No: 11	Wi-Fi Security Management in Computer and Mobile
Date:	

Aim

To study and configure **Wi-Fi security settings** in computers and mobile devices to protect the network from unauthorized access.

Requirements

- Computer / Laptop with Wi-Fi adapter
- Smartphone (Android / iOS)
- Wireless router / hotspot
- Internet connection

Theory

Wi-Fi security refers to the protection of wireless networks from unauthorized users and cyber threats. Security methods such as **WPA2 and WPA3 encryption** help protect data transmitted over wireless networks.

Wi-Fi security helps to:

- Prevent unauthorized access
- Protect personal data
- Avoid network attacks
- Ensure safe internet usage

Common security techniques include:

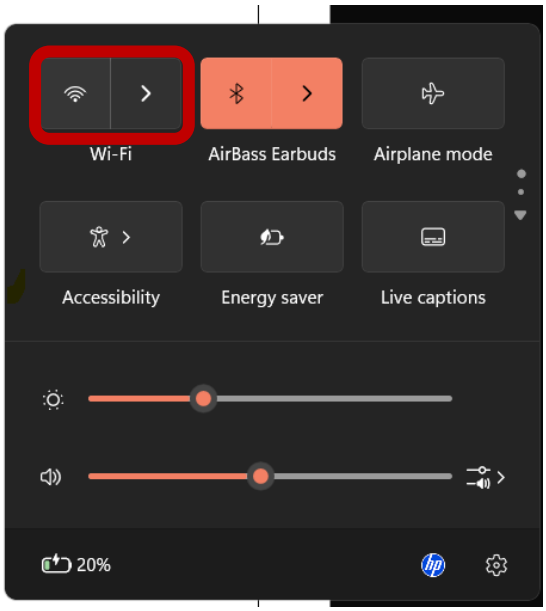
- Strong Wi-Fi passwords
- Network encryption
- Hiding SSID
- MAC address filtering

Procedure

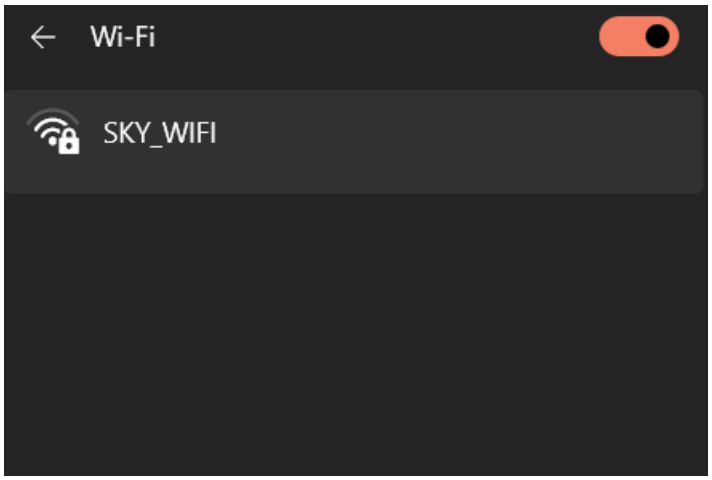
A. Wi-Fi Security Management in Computer

1. Click the **Wi-Fi icon** in the taskbar.

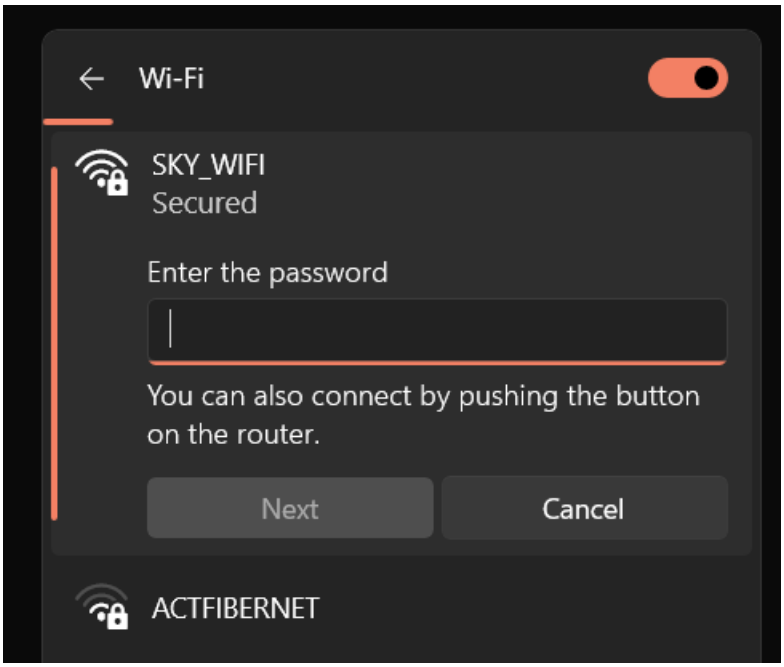
2. Turn on **Wi-Fi** in the computer.



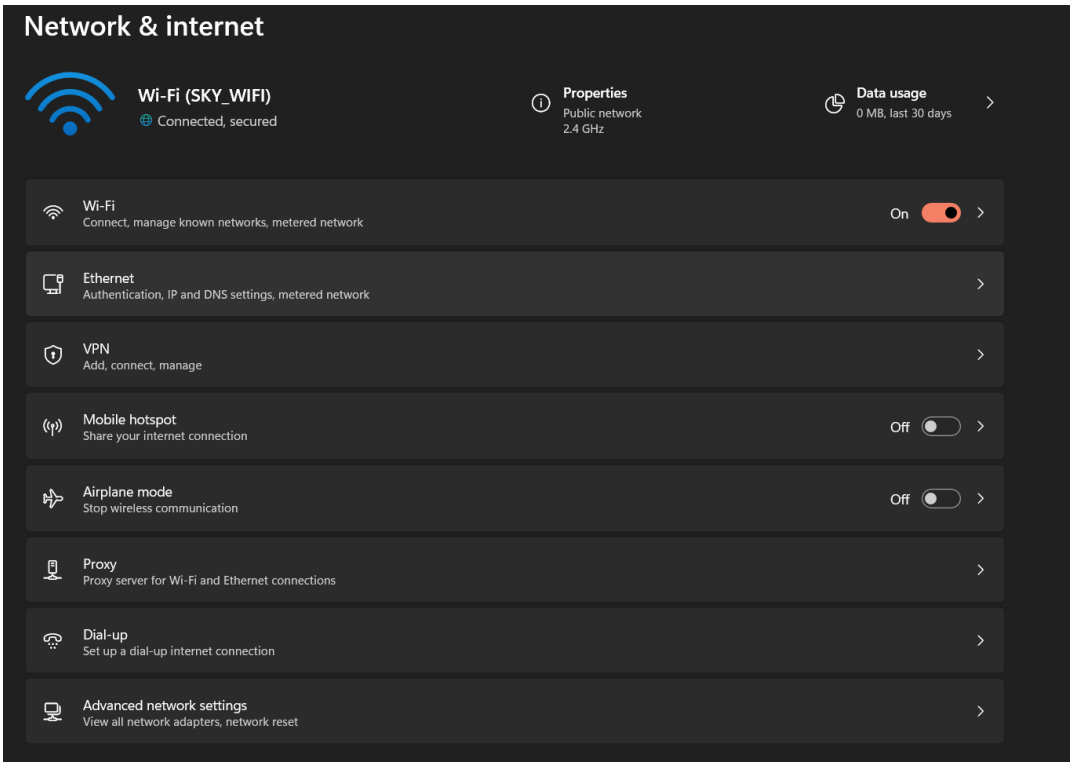
3. Select the required Wi-Fi network.



4. Enter the **secure password** to connect.

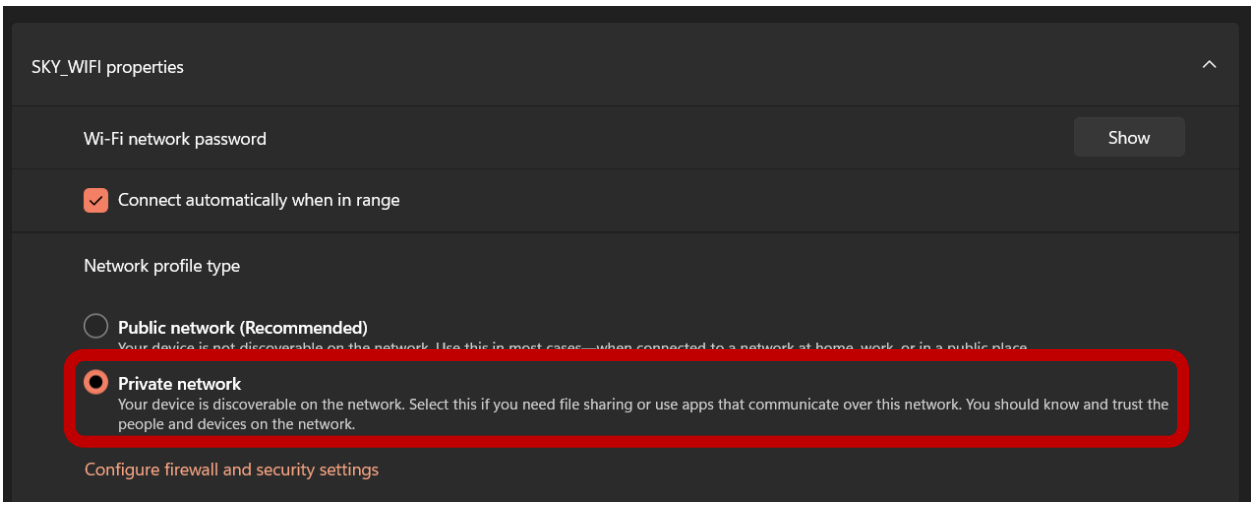


5. Open **Network & Internet Settings**.



6. Verify the **security type** (WPA2 / WPA3).

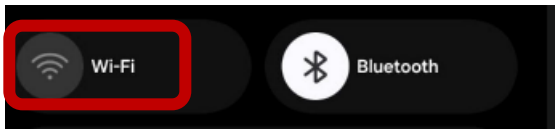
7. Set the network profile to **Private** for better security.



B. Wi-Fi Security Management in Mobile

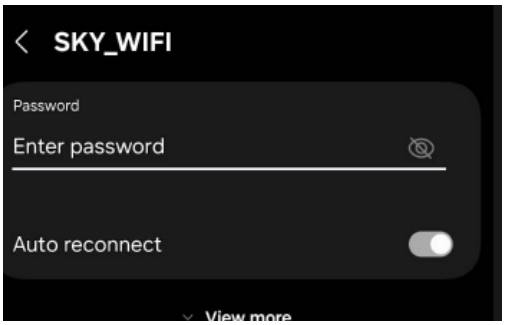
1. Open **Settings** in the mobile device.

2. Select **Wi-Fi**.

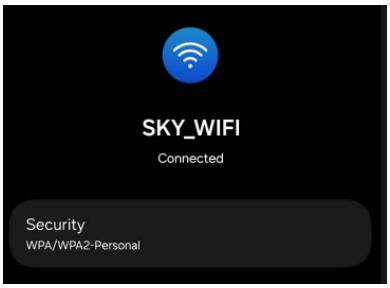


3. Choose the available wireless network.

4. Enter the **Wi-Fi password** to connect.



5. Check the **security type** of the network.



Result

Thus, **Wi-Fi security management in computer and mobile devices** was successfully studied and configured to ensure secure wireless network access.
